Overview

The Biopharma Collaborative (BPC) Core Team has created analytic datasets that include data from:

- AACR Project GENIE Tier 1 registry
- Institutional tumor registries
- Manual curation based on institutions' electronic health records (PRISMM phenomic data model)
- Derived variables based on these data elements

These datasets contain demographic and phenomic information to augment the genomic data in Project GENIE. This document serves as a resource for all data elements included in the analytic datasets.

Release Notes

This document accompanies release AACR Project GENIE BPC NSCLC v1.1-consortium.

- For this release, patients who are >89 years at any time point are not included. These patients will be included in future releases of the data with specific data redacted in order to protect patient privacy.

BPC Projects

The BPC sponsors six projects, each corresponding to a single cancer disease type. The six projects are: bladder cancer, breast cancer, colon/rectum cancer, non-small cell lung cancer (NSCLC), pancreas cancer, and prostate cancer. Patients can only be included in one BPC Project (e.g. a patient selected for the NSCLC BPC Project will not be included in subsequent BPC Projects).

Eligibility

Patients are eligible for curation based on having a BPC Project-specific cancer. Cases meeting specified eligibility criteria are randomly selected from the AACR Project GENIE Cancer Registry for enhanced PRISMM phenomic data curation.

The BPC Project-specific eligibility criteria for the NSCLC Project are as follows:

- Eligible OncoTree Diagnoses:
 - Non-Small Cell Lung Cancer (NSCLC)
 - Ciliated Muconodular Papillary Tumor of the Lung (CMPT)
 - Large Cell Lung Carcinoma (LCLC)
 - Lung Adenocarcinoma (LUAD)
 - Pleomorphic Carcinoma of the Lung (LUPC)
 - Lung Squamous Cell Carcinoma (LUSC)
 - Poorly Differentiated Non-Small Cell Lung Cancer (NSCLCPD)
 - Lung Adenosquamous Carcinoma (LUAS)
 - Mucoepidermoid Carcinoma of the Lung (LUMEC)
 - Lymphoepithelioma-like Carcinoma of the Lung (LECLC)
 - Clear Cell Carcinoma of the Lung (CCLC)
 - Large Cell Lung Carcinoma With Rhabdoid Phenotype (RLCLC)
 - Giant Cell Carcinoma of the Lung (GCLC)
 - Basaloid Large Cell Carcinoma of the Lung (BLCLC)
- Stage I-IV at diagnosis
- Genomic sequencing report at:

- DFCI, MSK, or VICC between January 1, 2014 and December 31, 2017
- UHN between January 1, 2014 and December 31, 2015
- Aged 18 or older at the time of genomic sequencing
- Minimum of two years of follow-up after sequencing

These selection criteria could affect the ability to generalize to the entirety of patients with NSCLC. Genomic sequencing is not always performed at diagnosis and therefore may lead to several forms of bias, including immortal time bias. Investigators who wish to test specific hypotheses should work with a statistician to perform analyses that account for these biases. Failure to do so may result in incorrect inferences.

Format

This data guide is sectioned by the eight analytic datasets included in the NSCLC BPC Project:

The format of each variable is as follows:

Field name

[Variable name]

Value (character/numeric/date/date-time)

Description of the field

Data Standard (where applicable)

Field names shaded in gray indicate that the variable is provided for completeness, but that another variable is preferred. For example, age at diagnosis is captured from the tumor registry and from curation, but the derived variable combining the two sources is the variable that should be used for analysis. In this case, the tumor registry and curated age at diagnosis are shown with gray shading.

Variables have been color coded to help users understand their provenance.

Variables shown in **orange** indicate variables obtained from the AACR Project GENIE Tier 1 data.

Variables shown in **green** indicate variables obtained directly from the hospital tumor registry,

Variables shown in **blue** indicate curated variables as well as variables pertaining to curation and quality assurance (QA),

Variables shown in **purple** indicate derived variables.

The following table provides further information about the types of variables.

Type of Variable	Description
------------------	-------------

AACR Project GENIE Tier 1 Data	<p>Variables denoted in orange represent data that is obtained directly from the AACR Project GENIE Tier 1 Data. These variables are included in the analytic datasets for ease of analysis and will correspond to the values stored for each sample in the Tier 1 Data.</p> <p>Users should refer to the AACR Project GENIE website for further detail.</p>
Tumor registry at each institution	<p>Variables denoted in green are obtained from each hospital's tumor registry system. These are NAACR-defined variables and thus are highly standardized across institutions. Not all patients have their data captured by the tumor registry. The provenance of the data is abstraction by Certified Tumor Registrars at each institution.</p> <p>The NAACCR data standards are noted for each registry-specific field and users should refer to the NAACCR website for further detail.</p>
Curated	Variables denoted in blue have been curated according to the PRISMM phenomic data curation model to extract non-structured data from the EHR.
Derived	<p>Variables denoted in purple are calculated based on AACR Project GENIE Tier 1, tumor registry and/or curated variables. These variables are provided to facilitate ease of use as well as consistency across different analyses.</p> <p>In general, data may be obtained from the institution's tumor registry, if available, or from manual curation if not available in the tumor registry or if more current information is available. It is recommended that the derived data elements combining the tumor registry and curated data be used for analyses.</p>

Cancer-Directed Regimen Dataset

The cancer-directed regimen dataset is structured as one record per regimen-associated cancer diagnosis, per patient. For example, if a regimen is associated with a single cancer diagnosis, there will be one corresponding record in this dataset. If a regimen is associated with two cancer diagnoses, then there will be two corresponding records in this dataset: one for the first associated cancer diagnosis and another for the second associated cancer diagnosis, etc.

*Cancer-directed regimens were curated for **all** cancer diagnoses, including both BPC Project and non-BPC Project cancers. A regimen can consist of one drug or up to five drugs given together. Cancer-directed drugs include anti-neoplastic drugs, immunotherapies, targeted therapies, and hormone therapies. A break in treatment of ≥ 8 weeks was used to indicate the end of a regimen; even if all drugs in the regimen were re-initiated 8+ weeks later, this was considered a new regimen.*

The Cancer-Directed Regimen dataset can be linked to the following datasets:

- BPC Project and non-BPC Project cancer diagnosis datasets using the variables [record_id] and [ca_seq]
- Cancer panel test dataset using the variables [record_id] and [ca_seq]
- Patient-level, PRISMM Pathology, PRISMM Imaging, and PRISMM Medical Oncologist Assessment datasets using [record_id].

Field names shaded in gray indicate that an alternative variable is preferred for analysis. The preferred variable is noted in the description.

Cancer Panel Test Dataset

The Cancer Panel Test dataset is structured as one record per cancer panel test and its associated cancer diagnosis, per patient. For example, if a cancer panel test was associated with one cancer diagnosis, there will be one corresponding record in this dataset. If a cancer panel test was associated with two cancer diagnoses, then there will be two corresponding records in this dataset: one for the first associated cancer diagnosis and another for the second associated cancer diagnosis, etc. The terms “cancer panel test (CPT)” and “next generation sequencing (NGS)” are used interchangeably.

The Cancer Panel Test dataset can be linked to the following datasets:

- *BPC Project Cancer Diagnosis dataset using the variables [record_id] and [ca_seq]*
- *Cancer-Directed Drug Regimen dataset using the variables [record_id] and [ca_seq]*
- *PRISMM Pathology dataset using [record_id], [ca_seq], [path_proc_number] and [path_report_number]*
- *Patient-Level, PRISMM Imaging, and PRISMM Medical Oncologist Assessment datasets using [record_id]*
 - *Cannot be linked to the Non-BPC Project Cancer Diagnosis dataset because non-BPC Project cancer diagnoses were not genomically sequenced (Appendix 1)*

Field names shaded in gray indicate that an alternative variable is preferred for analysis. The preferred variable is noted in the description.

- This variable is missing if the diagnosis associated with the NGS test is unknown.
- Note that NGS tests may be associated with multiple NSCLC BPC Project cancer diagnoses when the actual cancer diagnosis cannot be identified. In this case, each associated cancer diagnosis will be a separate row in the dataset.
- Primary key for the cancer diagnosis, cancer-directed regimen and cancer panel test datasets.

Appendix 1. BPC Project and Non-BPC Project Cancers

Definition of BPC Project Cancer: A BPC Project cancer is the cancer that met the eligibility criteria for the project (i.e. genomic sequencing reported) and was selected at random for PRISMM phenomic data curation. The terms “BPC Project cancer” and “index cancer” are used interchangeably.

Scenario 1: Single BPC Project Cancer, No Second Primary NSCLC

Some patients may have more than one BPC Project cancer because they have multiple sequenced cancers that met the eligibility criteria. For example, a patient with a diagnosis of NSCLC that was sequenced in 2015 and a second primary of NSCLC that was sequenced in 2017 will have each diagnosis classified as a BPC Project cancer in the NSCLC BPC Project.

Scenario 2: Multiple BPC Project Cancers

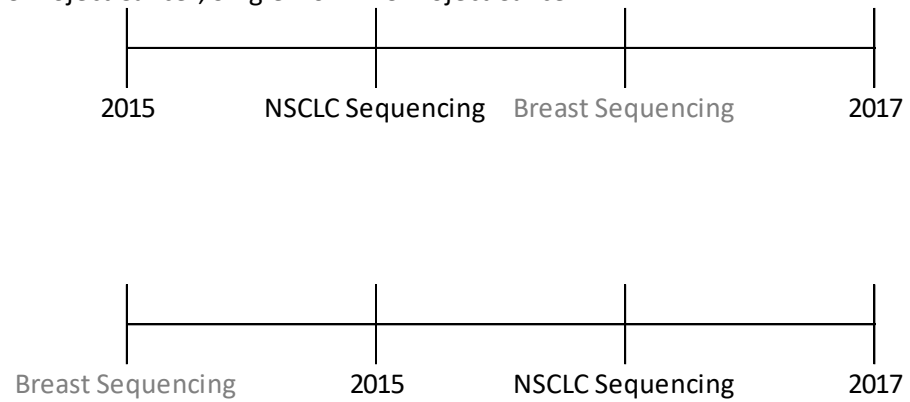

Definition of Non-BPC Project Cancer: A non-BPC Project cancer diagnosis can be a diagnosis of the same or different cancer type as the BPC Project cancer that occurs prior to, simultaneous with, or after the BPC Project cancer. Non-BPC Project cancers curated included: 1) non-BPC Project invasive cancer and in situ/non-invasive cancer diagnoses, and 2) other benign tumors. In a very small number of instances, some benign tumors (behavior codes 0 and 1), such as a benign brain tumor or a hemangioma, are obtained from the institution’s tumor registry. These tumors were ineligible for curation, in which case only the tumor registry data is available.

The non-BPC Project cancers do not have associated genomic sequencing.

A non-BPC Project cancer diagnosis could be a different cancer type altogether, such as a breast cancer diagnosis in a patient included in the NSCLC BPC Project. The NSCLC cancer is the cancer that made the patient eligible for the BPC Project, but some information regarding the breast cancer diagnosis was curated.

Scenario 3: Single BPC Project Cancer, Single Non-BPC Project Cancer

In Scenario 3, the breast cancer that was sequenced is classified as a non-BPC Project cancer for the NSCLC BPC Project. Note that a patient can only be selected for one BPC project (e.g. if patient is selected for the NSCLC project, then the patient cannot be selected for the breast cancer project).

Appendix 3. Curation Instructions for Medical Oncologist Assessments

- Find the date of diagnosis of the cancer of interest.
- Some patients have more than one cancer diagnosis. **Do** review and curate only notes for the cancer of interest.
- **Do** review and curate one clinical assessment per month, beginning at time of diagnosis.
 - **Do** choose first Medical Oncology note of the month that is authored by an MD actively following the patient for the cancer of interest.
 - If there is no note by a medical oncologist (MD) that month. **do** use the first note by a nurse practitioner or physician assistant (NP/PA) from a medical oncology practice.
 - **Rarely** look at more than one note per month. If the patient has imaging scans after the first note in the month, look on or up to 7 days following the imaging scans.
 - **Do** give priority to internal visit notes. Only curate notes from an outside institution if there is no DFCI/Partners oncology note in that month. Prioritize as follows:
 1. Internal MD
 2. Internal NP/PA
 3. External MD
 4. External NP/PA
 - If a fellow has a note and an attending physician adds an addendum, review any information in the Summary/impression/Evaluation/Plan, including the addendum.
 - **Do not** use notes from Radiation Oncology. Surgery/Surgical Oncology, inpatient care, primary care, or other specialists not related to cancer (e.g. dermatology, cardiology).
 - Patients with early stage cancers are sometimes only followed by a surgical oncologist. This may mean that they are many months without notes that qualify for curation. That is ok!
 - **Rarely** curate notes by an oncologist from a different specialty than the cancer of interest. Occasionally a patient will transfer care to a different type of oncologist due to the particulars of their disease. For example. a patient with brain metastases from their primary cancer may be followed by Neuro Oncology. **Do** curate these notes if notes from the primary oncologist are not available. **Do not** curate notes from a different oncology specialist that are pertaining to a different cancer diagnosis.
- **Do** review only the Impression/Plan section at the bottom of the note as well as the reason for visit.
 - **Rarely** a medical oncology provider will summarize the cancer status directly above the Impression/Plan section, which can be reviewed for curation.
- **Do not** review any of the other sections. including the physical exam, interval history, lab results. etc.
 - The Impression/Plan section may have a different name in medical oncologist progress notes; other section headers could include Assessment, Summary, Conclusion, Problem List Items Addressed this Visit.
 - When there are no section headings in a provider's note. **Do** review everything located beneath the physical exam.
